

Galaxy Cake by Jacob Burns

So there I was, in a space shuttle, off to get flour from Venus for our out of this world cake! I was making my super extra delicious deep space cake with my brother. Now, there we were, going into the cave on Venus where the flour is buried. But, there are three digging spots to choose from! Which one should I pick? I looked at Charlie and we both decided to go with the one farthest on the right. We found the flour in the hole as we dug. Next, I hear the countdown and we run for the ship...5...4...3...2...1 and we blasted off to Saturn, to get salt and ice. When we reached Saturn there was a big storm trying to pull us in. We got out by firing off all our thrusters and got away from its gravity. We carefully put the ship on autopilot while we went out to get the ice and salt. There was only ice, what should we do? But, we realized we saw salt in the big storm, so we must had to go back. We flew above the storm, so we didn't get sucked in. We lured ourselves into the middle with a cable attached to our spacesuits from the ship. We grabbed a big jar full of salt and went straight back inside the ship.

Once inside, we turned it to manual again and off we went to Neptune to get the sugar and eggs. We finally landed on Neptune and looked around. We didn't see any sugar, but then we saw a sugar bag floating into Neptune's blue spot. What are we going to do?! We went out and saved it, just barely. We located the eggs using our radar, they used to be in the blue spot, but now they are all the way back on Saturn. Don't ask me how they got there, but we need them, so we must go back. Once on Saturn we got the eggs, then flew to Pluto to see if the sprinkle comet was there. It had just passed when we arrived. It left a note though that said "After you have all the cake items I will be back at Earth, orbiting, until you need me. Bring the cake outside and I will rain sprinkles from above." We took the note with us and it had a map of where to find the 4 remaining ingredients attached to it; the butter, milk, vanilla and baking powder.

We followed the map on the note and it led us right to the ingredients. On the launch back to earth one of our eggs got out of the rocket ship and floated behind us. We didn't realize it flew behind our rocket engine, so when we blasted off the egg turned into dust. When we arrived back at Earth we went for a check to make sure we still had everything we needed. When we opened the egg carton one of the eggs was gone! So it was our egg that turned to egg dust! We remembered there were chickens here on Earth, so we headed home to our chickens in the backyard. We got one fresh laid egg. Now are ingredient list was complete.

We started baking the cake super-fast, because we knew we needed about 2 hours to bake the cake from start to finish. And that is exactly when the orbiting sprinkle comet will be directly overhead. We mixed all the ingredients after measuring out each one then got the cake in the oven. Thankfully, we still had an hour to bake the cake. And we still had an hour and a half until the comet is overhead. We waited, and after about 30 minutes the cake was done. We made frosting and got the cake iced and colored to look like the solar system. It was awesome with black, blue, orange and every color of the rainbow all whirled together. The comet was about to pass over us. We quickly went outside carrying the cake. Then, the sprinkle comet came over and said "Well done with the cake! Can I have some after I rain sprinkles?". We said "sure!". So he rained sprinkles on the cake and we gave him a piece. He said "You did a great job of this cake...mmmmmm, delicious!". And that was our adventure making a deep space cake.
